

# JAVA

## CASE : jdwp --> read more about it

attaching a java debugger  
uses jdb --> java debugger  
jdb> classpath  
>classes  
methods java.lang.Runtime

searches for runtime library because it is the easiest to run code with  
>threads  
he usually runs  
stop in java.lang.Strings.indexOf(int)

better way to do it is  
jdwp-shellifier --> git clone it
